

Solution Design Template for Perplexity Labs Automation

Overview

Use this template to provide Perplexity Labs with all the essential information needed to automate and generate your resume agent solution. This structure is optimized to leverage Labs' strengths—coding, automation, reporting, and mini-app creation—while clarifying your expectations and solution boundaries.

1. Project Goal

Describe in 1-2 sentences:

- The high-level purpose of your solution.
- The target user and core outcome.

Example:

"Build a personal agent that automates the creation of tailored resumes, cover letters, and key selection criteria responses for job applications in the Australian Community Services sector."

2. Core Features

List the minimum required functionalities Labs should automate:

- Generate resumes based on provided user profile and job descriptions.
- Generate cover letters tailored to job ads.
- Generate responses for key selection criteria from job ads.
- Store generated documents and track job applications.
- (Optional) Summarize and report on job applications and document usage.

3. Inputs & Outputs

Inputs

- User Profile Information (name, contact, experience, skills)
- Job Advertisement Text (or link)
- Selection Criteria (from job ad)
- (Optional) User preferences (tone, formatting)

Outputs

- Resume document (PDF, DOCX, or text)
- Cover letter document (PDF, DOCX, or text)
- Selection criteria response document
- (Optional) Job application tracking dashboard or report

4. Workflow Steps

1. **User submits:** job ad details + personal profile.
2. **System automatically generates:**
 - a. Resume,
 - b. Cover letter,
 - c. Key selection criteria responses.
3. **System stores:** all generated documents for download or review.
4. **(Optional) System tracks:** applications and compiles a basic reporting dashboard.

5. Deployment Requirements

- The solution should be accessible across devices (web-app, mobile browser, PWA, or mini-app).
- Prefer free, low-cost hosting/deployment.
- Integration with Google Gemini (user will provide API key).
- Store data in a simple table, spreadsheet, or database (Labs or Google Sheets acceptable).
- No user management needed (single user).

6. Minimum Technical Specifications for Labs

- Preferred tech stack: Python (Flask or FastAPI) for backend, simple HTML/JS or React for frontend; alternatively, use built-in Labs mini-apps or dashboards.
- All code and generated assets should be downloadable.
- Provide an OpenAPI or basic REST endpoint documentation if possible.
- Instructions to deploy as a simple web app, dashboard, or PWA.

7. What Perplexity Labs Should (and Shouldn't) Do

Labs Should Do	Labs Should NOT Do
Write code for backend APIs, document generation logic, and basic frontend	Integrate with complex, external SaaS
Prototype dashboards or mini web apps for user interaction/download	Implement advanced authentication flows
Auto-generate code for document formatting and output	Build native mobile apps
Automate asset management (store, link, export files) via built-in Labs dashboards or assets	Perform deployment to cloud providers

Labs Should Do	Labs Should NOT Do
Suggest deployment/readme instructions	Require user sign-in/multi-user logic
Integrate with Google Sheets for tracking, if feasible	Manage 3rd-party API quotas

8. Essential Instructions for the Lab

"Automate as much as possible:

- Generate all skeleton project files (backend, frontend, deployment scripts).
- Implement functions for resume, cover letter, and criteria document generation.
- Create a tracking spreadsheet or dashboard for sent applications.
- Provide a proof-of-concept web interface or mini app.
- Include a README with usage, dependencies, and deployment steps.
Use built-in assets and code runners where possible.
Rely on provided sample data for testing; do not simulate external dependencies outside your capabilities."

9. (Optional) Sample Data for Testing

- Provide a dummy user profile.
- Paste a typical job advertisement.
- List example selection criteria.

10. Final Checklist

- [] All major features are described in short, clear requirements.
- [] Inputs and outputs are explicitly listed.
- [] Specific tasks for Labs vs. user/manual post-processing are clear.
- [] Minimal required external integrations are specified.
- [] Sample data is included.

Copy, fill, and use this template as your Perplexity Labs project prompt to maximize automation and produce a deployable agent solution efficiently.
